

发布时间: 2022/09/19

此文档适用于 wireless_mic_sdk-v1.4.0_2t1 SDK 及以上版本

说明:

此文档用于说明如何添加按键实现两发一收 SDK 的绑定配对功能

1. 功能说明

绑定配对用于实现 TX 和 RX 的绑定连接,两个设备绑定之后,除非清除绑定记录,否则无法与其他设备进行连接。下面以双击按键清除绑定配对流程为例:

2. TX 端相关修改

2.1. 开启绑定配对的宏

```
*board_wireless_mic_2t1_tx_cfq.h \times
        #define WIRELESS MIC OUTPUT DAC SAMETIME DISABLE
   43
   44
   45
        #define WIRELESS_TOOL_BLE_NAME_EN ENABLE
        //rf测试,由工具触发样机进入dut模式
   46
        #define TCFG_RF_TEST_EN
   47
                                         DISABLE
   48
   49
        //配对绑定
   50
        #define WIRELESS_PAIR_BONDING
                                           1//DISABLE
   51
        //使用PA延长距离,需要硬件添加PA电路,默认使用PC2/PC3
   52
        #define CONFIG_BT_RF_USING_EXTERNAL_PA_EN DISABLE
   53
   54
                             app 配置
   55
   56
        #define TCFG APP BT EN
   57
        #define TOFG ADD MILISTO FAL
```

2.2. 添加按键清除绑定记录

```
*board_wireless_mic_2t1_tx_cfg.h
                      × *2t1_tx.c ×
  487
               if (flag poweroff
        H
  488
                  if (++key poweroff cnt >= POWER OFF CNT) {
                     key poweroff cnt
  489
  490
                     ret = 1;
  491
  492
  493
  494
               break:
            case KEY BLE PAIR:
  495
          #if WIRELESS PAIR BONDING
  496
  497
               clear_bonding_info();
  498
               ble module enable(1);
  499
         #endif // WIRELESS PAIR BONDING
  500
               break:
  501
            case KEY NULL:
  502
               break:
  503
  504
            return ret;
  505
  506
```

```
*board_wireless_mic_2t1_tx_cfg.h
                   \times *2t1_tx.c \times *key_event_deal.h \times
  185
          KEY_WIRELESS_MIC_ECHO_SYNC\//混响同步
  186
          KEY_ENTER_PAIR,//1tn 进入配对权
  187
          KEY_EXIT_PAIR,//1tn 退出配对模
          KEY_WIRELESS_MIC_CH_SW,//2t1il
  188
  189
          时输出到dac
  190
          KEY_MODE_SW,//模式切换
  191
          KEY RECORD SW.
          KEY WIRELESS 2t1_RX_SEND_DATA,//武发一收rx发送数据
  192
  193
          KEY_BLE_PAIR,
  194
                           流程, 用于不重要得其也操作
  195
          KEY_MINOR_OPT,
  196
  197
          KEY_NULL = 0xFFFF,
  198
  199
          KEY_MSG_MAX = 0xFFFF,
          //音箱sdk 按键消息已经加太为0xffff
  200
  201
  202
  203
```

```
_wireless_mic_2t1_tx_cfg.h \times | *2t1_tx.c \times | *key_event_deal.h \times | *iokey_table.c \times |
1 2
      include "key_event_deal.h" include "key_driver.h"
      include "app_config.h"
include "app_task.h"
      ifdef CONFIG_BOARD_WIRELESS_MIC_2T1_TX
     Fonst u16 key_io_table[KEY_IO_NUM_MAX][KEY_EVENT_MAX] = { //单击 //长拉 //hold //抬起 //双击
           KEY_WIRELESS_MIC_DENOISE_SET, KEY_POWEROFF, KEY_POWEROFF_HOLD, KEY_NULL, KEY_BLE_PAIR, KEY_REQ
10
11
12
           KEY_NULL, KEY_NULL,
                                          KEY_NULL, KEY_NULL, KEY_NULL, KEY_NULL
13
14
15
           KEY_NULL, KEY_NULL,
                                          KEY_NULL, KEY_NULL, KEY_NULL,
                                                                                    KEY NULL
16
17
18 ⊨
```

2.3. 控制第一次上电连接状态

```
1073
        #if TCFG WIFI DETECT ENABLE
 1074
         wifi_detect_set_master_first(TCFG_V
                                        FI_DETCET_PRIOR);
 1075
        #endif
 1076
 1077
        #if (WIRELESS_24G_ENABLE)
         rf_set_24g_hackable_coded(WIRELESS_24G_CODE_ID);
 1078
 1079
 1080
 1081
          set ble work state(BLE ST INIT OK);
       #if WIRELESS_PAIR_BONDING
 1082
 1083
          if(conn pair info.pair flag){
 1084
            ble_module_enable(1);
 1085
          else
 1086
            ble_module_enable(0);
 1087
 1088
        #else
 1089
          ble_module_enable(1);
        #endif // WIRELESS_PAIR_BONDING
 1090
 1091
 1092
 1093
 1094
        void bt_ble_exit(void)
```

3. RX 端相关修改

3.1. 开启绑定配对的宏

```
*board_wireless_mic_2t1_rx_cfg.h ×
  43
  44
     #define WIRELESS_TOOL_BLE_NAME_EN
                               ENABLE
     //rf测试,由工具触发样机进入dut模式
  45
     #define TCFG_RF_TEST_EN
                            DISABLE
  46
     47
  48
  49
                            50//demo板测试50太概对它1米的距离,越大越远
  50
     #define TCFG_WIRELESS_RSSI
  51
  52
                              1/ADISABLE
  53
     #define WIRELESS PAIR BONDING
  54
     //使用PA延长距离,需要硬件添加PA电路,默认使用PC2/PC3
  55
  56
     #define CONFIG_BT_RF_USING_EXTERNAL_PA_EN DISABLE
  57
     //*********************
  58
     59
```

3.2. 添加按键清除绑定配对

```
× *2t1_rx.c × 2t1_tx.c ×
*board_wireless_mic_2t1_rx_cfg.h
  496
                if (flag poweroff
  497
                   if (++key_poweron cnt >= POWER_OFF_CNT) {
  498
                      key_poweroff_cnt
  499
                      ret = 1;
  500
  501
  502
  503
                break
          case KEY_BLE_PAIR:
#if WIRELESS_PAIR_BONDING
  504
  505
                clear_bonding_info();
  506
  507
                ble module enable(1);
  508
          #endif // WIRELESS_PAIR_BONDING
  509
                break
  510
  511
             case KEY_NULL:
  512
                break
  513
  514
             return ret;
  515
```

```
× board_wireless_duplex_dongle_cfg.h
                                                  × key_event_deal.h × key_ever
duplex_dongle.c
                                  × le_wireless_mic_client.c
 187
          KEY EXIT PAIR,//1tn 退出配对模式
 188
          KEY_WIRELESS_MIC_CH_SW,//2t1通道切换
 189
